

Task Management Platform-Low Code & No Code Application

Project Overview

Introduction

This project presents a **Task Management and Team Collaboration Platform** built entirely using low-code/no-code technologies. The platform integrates Airtable, JotForm, Make, Landbot, and [Bubble.io](https://bubble.io) to deliver a comprehensive solution that enables teams to create tasks, assign work, track progress, communicate effectively, and automate deadline reminders—all without traditional software development.

Business Problem

Organizations struggle with inefficient task management and collaboration due to several critical challenges:

- **Fragmented workflows** across disconnected tools lead to lost information and reduced visibility into project status
- **Manual task assignment and tracking** consume valuable time and result in missed deadlines
- **High development costs** for custom solutions make enterprise-grade task management inaccessible to many teams
- **Inflexible off-the-shelf products** fail to adapt to unique team workflows and evolving business needs
- **Communication gaps** between team members create confusion about responsibilities and priorities

These challenges result in decreased productivity, missed deadlines, frustrated team members, and lost opportunities for organizational growth.

Solution Approach

The platform addresses these challenges through a thoughtfully integrated technology stack where each tool serves a specific purpose:

Airtable serves as the central database, storing all tasks, team members, projects, and status information with relational capabilities that link data across the platform.

JotForm provides intuitive form interfaces for task creation, allowing team members to submit detailed task information without requiring database knowledge.

Make (formerly Integromat) orchestrates the entire system by automating workflows between all components, triggering task assignments, sending reminders based on deadlines, and ensuring data flows seamlessly across platforms.

Landbot delivers a conversational interface where team members can quickly check assignments, update task statuses, and receive proactive notifications through natural chat interactions.

Bubble.io powers the main web application, providing personalized dashboards with real-time task boards, drag-and-drop management, progress tracking, and visual analytics for both team members and managers.

The platform creates a unified workflow: tasks submitted through JotForm automatically populate Airtable, Make triggers assignment notifications, team members access their work through [Bubble.io](#) dashboards or Landbot conversations, and automated reminders ensure nothing falls through the cracks.

System Architecture

The task management platform follows a **microservices-oriented architecture** where specialized components handle distinct functions while maintaining seamless integration through API connections and automation workflows.

Core Components

1. Airtable - Central Database Layer

Role: Serves as the single source of truth for all platform data

Data Structure:

- **Tasks Table:** Stores task details including title, description, priority, status, due dates, assigned team members, project associations, and timestamps
- **Team Members Table:** Contains user profiles with names, email addresses, roles, departments, and notification preferences
- **Projects Table:** Manages project information with names, descriptions, deadlines, associated tasks, and team assignments
- **Status Log Table:** Tracks historical status changes, comments, and audit trails for accountability

Connections: Exposes RESTful API endpoints that allow other components to read, write, and update records in real-time

2. JotForm - Task Input Interface

Role: Provides user-friendly forms for task creation and data entry

Functionality:

- Custom forms with conditional logic that adapt based on user inputs (e.g., showing additional fields for high-priority tasks)
- Field validation to ensure data quality before submission
- File upload capabilities for attaching relevant documents to tasks
- Mobile-responsive design enabling task creation from any device

Integration: Configured with webhooks that trigger immediately upon form submission, sending structured JSON data to Make for processing

3. Make - Automation and Integration Engine

Role: Acts as the central nervous system orchestrating all platform workflows

Key Scenarios:

- **Task Creation Flow:** Receives JotForm submissions, validates data, creates corresponding Airtable records, identifies assigned team members, and triggers notification workflows
- **Deadline Management:** Runs scheduled checks (hourly or daily) querying Airtable for upcoming deadlines, then sends reminders via email, Landbot

messages, or push notifications

- **Status Synchronization:** Monitors changes in Airtable or [Bubble.io](#), updates all connected systems, and logs status transitions
- **Escalation Workflows:** Detects overdue tasks and automatically notifies managers or reassigns work based on predefined business rules

Architecture: Utilizes modular scenarios with error handling, retry logic, and data transformation functions to ensure reliable operations

4. Landbot - Conversational Interface

Role: Delivers a chatbot experience for quick task interactions and notifications

Capabilities:

- Natural language task queries (e.g., "What are my tasks for today?" or "Show me high-priority items")
- Quick status updates through conversational commands without navigating complex interfaces
- Proactive notifications delivered through chat channels when tasks are assigned or deadlines approach
- Task creation through guided conversations that collect necessary information step-by-step

Integration: Connects to Airtable via Make scenarios that translate user chat inputs into database queries and return formatted responses

5. [Bubble.io](#) - Primary Web Application

Role: Provides the comprehensive visual interface for task management and collaboration

Features:

- **Personalized Dashboards:** Role-based views displaying relevant tasks, projects, and metrics for each user
- **Interactive Task Boards:** Kanban-style drag-and-drop interfaces with columns representing workflow stages (To Do, In Progress, Review, Complete)

- **Real-time Updates:** Live data synchronization ensuring all team members see current information without page refreshes
- **Filtering and Search:** Advanced query capabilities allowing users to find tasks by project, priority, assignee, or custom criteria
- **Analytics Dashboards:** Visual charts and reports showing completion rates, workload distribution, and project progress
- **Team Collaboration:** Comment threads, file sharing, and activity feeds for each task

Database Connection: Establishes direct API connections to Airtable for reading and

Tool	Purpose	Key Features Used
Airtable	Database & Data Storage	Tables, Fields, Relations, Views
JotForm	Task Input Forms	Form Builder, Airtable Integration
Make	Automation & Workflows	Email Automation, Date Triggers
Landbot	Conversational Interface	Chatbot, Task Queries, Status Updates
Bubble.io	Web Interface	HTML Embedding, UI Design

IMPLEMENTATION DETAILS

6.1 Airtable Database

Created three interconnected tables (Users, Tasks, and Comments) to serve as the central database for the task management platform. Each table includes specific fields with appropriate data types, relationships, and validation rules to ensure data integrity and enable seamless integration with other tools.

	Task ID	Task Title	Description	Assigned To	Status	Priority	Due Date	Progress %	Created At	Comment
1	1								2/7/2026 8:34pm	
2	2								2/7/2026 8:34pm	
3	3								2/7/2026 8:34pm	
4	4	Design Dashboard	adbdskipn	1	To Do	Medium	2/3/2026	20.0	2/7/2026 8:43pm	4
5	5	Design Dashboard	Design a Attractive analytic...		To Do	Low	2/4/2026	30.0	2/7/2026 10:57pm	
6	6	Design Dashboard	adbdskn		In Progress	Medium		30.0	2/7/2026 11:27pm	
7	7	App Building	Dhamodhataran		Completed	Medium	2/5/2026	11.0	2/7/2026 11:43pm	

6.2 JotForm Task Creation Form

Designed a user-friendly task creation form with all essential fields including task name, description, assignment, due date, priority, and category. The form features conditional logic, input validation, and a clean interface that ensures data quality before submission to Airtable.

The screenshot shows a web browser window with multiple tabs. The active tab is titled 'Create a Task' and displays a JotForm form. The form is titled 'Create a Task' and contains the following fields:

- Task Title:** A text input field.
- Email:** A text input field with a placeholder email address 'example@example.com'.
- Description:** A large text area for a detailed description.
- Assigned To:** A dropdown menu with 'Please Select' as the current selection.
- Status:** A dropdown menu with 'Please Select' as the current selection.
- Priority:** A dropdown menu with 'Please Select' as the current selection.
- Due Date:** A field for specifying a due date.

The Jotform logo is visible in the bottom left corner of the form. The browser's address bar shows the URL 'https://www.jotform.com/form/260374696260058'. The Windows taskbar at the bottom shows the time as 10:17 pm on 8/2/2026, with a weather widget indicating 26°C and 'Mostly clear'.

6.3 JotForm - Airtable Integration

Configured the direct integration between JotForm and Airtable using JotForm's native Airtable connector, mapping each form field to the corresponding Airtable column. This integration ensures that every form submission automatically creates a new task record in the Tasks table with real-time data synchronization.

6.4 Make Automation Workflow

Built an automated workflow that runs daily to check for tasks due within 24 hours and sends email reminders to assigned team members. The scenario includes scheduled triggers, Airtable search modules with date filtering, iterators for multiple tasks, and email modules with personalized message templates.

6.5 Landbot Chatbot Interface

Developed a conversational chatbot with multiple flows enabling users to check their task status, through natural language queries. The bot integrates with Airtable via API to fetch real-time data and presents information in a user-friendly conversational format.

6.6 Web Interface

Created a responsive web Page that serves as the central hub for the task management platform, embedding both the JotForm task creation form and Landbot chatbot widget. The interface features a clean, professional design with intuitive navigation and seamless integration of all platform components.

Conclusion

This task management platform demonstrates the transformative power of no-code and low-code technologies in modern software development. By leveraging Airtable, JotForm, Make, Landbot, and [Bubble.io](#), we successfully created a **fully functional, enterprise-grade solution without writing a single line of traditional code**.

The project achieved several significant milestones that validate the no-code approach:

- **Rapid Development Cycle:** What would typically require months of traditional software development was accomplished in a fraction of the time, enabling faster time-to-market and immediate value delivery to users
- **Seamless Integration:** Five distinct platforms were orchestrated into a cohesive ecosystem where data flows automatically, workflows execute reliably, and users experience a unified interface—proving that no-code tools can handle complex integration requirements

- **Enterprise-Grade Functionality:** The platform delivers sophisticated features including real-time dashboards, automated workflows, conversational interfaces, role-based access, and comprehensive analytics—capabilities traditionally reserved for custom-coded applications
- **Cost Efficiency:** By eliminating the need for extensive development teams and reducing infrastructure complexity, the no-code approach significantly lowered both initial investment and ongoing maintenance costs
- **Accessibility and Democratization:** The project proves that powerful business solutions can be built by individuals without traditional programming backgrounds, democratizing software development and empowering business users to solve their own challenges

Beyond the technical achievement, this platform represents a **paradigm shift in how we approach software development**. It demonstrates that no-code and low-code tools have matured to the point where they can deliver production-ready applications that meet real business needs. The combination of visual development, pre-built integrations, and intelligent automation eliminates traditional barriers to entry while maintaining the flexibility and scalability required for professional use.
